DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on April 7, 2009 has been entered.

Drawings

2. The drawings were received on October 27, 2008. These drawings are accepted by the Examiner.

Allowable Subject Matter

3. Claims 5-7 and 9-15 are allowed.
4. The following is an examiner's statement of reasons for allowance:
5. U. S. Patent No. 6,532,433 to Bharadwaj et al. is the reference closest to the claimed invention. Bharadwaj et al. disclose a compressor having a series of turbine blades that are housed in a casing, wherein certain movements of the turbine blades generate pressure waves that propagate to the casing and thereby cause the casing to vibrate, a method of estimating the operable life of turbine blades in the compressor,

said method comprising the steps of: sensing vibrations in the casing caused by movement of the turbine blades; correlating the sensed vibrations to a frequency value representative of the vibration frequency of the casing; identifying when the turbine blades are subjected to a condition of rotating stall by determining when said frequency value is outside of a known range of frequency values of the casing during normal turbine blade operation; and factoring the identified condition of rotating stall into an estimation of the operable life of a turbine blade in the compressor. However, Bharadwaj et al. do not teach monitoring blade pass frequency of the turbine blades; sensing fluctuations in said blade pass frequency to identify a developing condition of rotating stall; and factoring the identified developing condition of rotating stall and the identified condition of rotating stall into an estimation of the operable life of a turbine blade in the compressor; and including all of the other limitations in the respective independent claims.

6. U. S. Patent No. 6,532,433 to Bharadwaj et al. is the reference closest to the claimed invention. Bharadwaj et al. disclose a system configured to estimate the operable life of turbine blades in a compressor, the system comprising: a compressor having a plurality of turbine blades that are housed in a casing, wherein certain movements of the turbine blades generate pressure waves that propagate to the casing and thereby cause the casing to vibrate; a sensor coupled to the casing, wherein the sensor is configured to sense vibrations in the casing and to generate a measurement signal representative of the sensed vibrations; and a processor coupled to the sensor, wherein the processor is configured to receive the measurement signal from the sensor

and to correlate the measurement signal to a frequency value representative of the vibration frequency of the casing; wherein the processor is further configured to identify when the turbine blades are subjected to a condition of rotating stall by determining when said frequency value is outside of a known range of frequency values for the casing during normal turbine blade operation; wherein the processor is further configured to communicate an identified condition of rotating stall to a lifetime estimation tool configured to estimate the operable life of turbine blades in the compressor; and wherein the lifetime estimation tool is configured to estimate the operable life of turbine blades in the compressor based at least in part on the identified condition of rotating stall. However, Bharadwaj et al. do not teach a compressor having a plurality of turbine blades that are housed in a casing and rotate at a predetermined blade pass frequency; the processor being further configured to identify a developing condition of rotating stall based upon fluctuations in the blade pass frequency of the turbine blades; the processor being further configured to communicate a developing condition of rotating stall; and the lifetime estimation tool being configured to estimate the operable life of turbine blades in the compressor based at least in part on the developing condition of rotating stall and the identified condition of rotating stall; .and including all of the other limitations in the respective independent claims.

7. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
